

Ali Taheri Motlagh

Senior Software Engineer / Angular &
TypeScript

*Six public products, each designed, built and
shipped end to end by one engineer.*

01

Remixt

AI music separation that runs
in the user's browser

02

Khalabani

An Airbus A320 you can fly in
a browser tab

03

Gridways

A complete mobile game in
about 80 kB

04

VasatYab

Find the fair place to meet

05

Siktir

Turn any link into a shareable
button

06

Project Island

A portfolio you can drive

REMIXT

AI music separation that runs in the user's browser

Split any song into vocals and beat, then remix it in a full studio.

PROBLEM

Separating a song into stems normally needs a server running a large AI model: slow to scale, costly to host, and it means uploading people's music.

WHAT I BUILT

Exported the Demucs model to ONNX and ran it in the browser on WebGPU, with a WebAssembly fallback. Added a multi-lane Web Audio studio with tempo and key matching, clip editing, effects and WAV export.

RESULT

No server-side inference. Original songs stay on the user's device.

KHALABANI

An Airbus A320 you can fly in a browser tab

A flight simulator with the A320 and the Cessna 172.

PROBLEM

Aircraft systems are many interacting parts that must stay consistent in real time, in a UI that remains clear under pressure.

WHAT I BUILT

Modelled fly-by-wire control laws, hydraulics, FADEC engines, ECAM, MCDU / FMGS, an autopilot with autoland and TCAS II. Built Tehran Mehrabad airport from official data and added touch controls.

RESULT

Automated tests check the aircraft against published performance data.

GRIDWAYS

A complete mobile game in about 80 kB

A traffic-routing puzzle for phones.

PROBLEM

Most web games download megabytes before you can play, and stutter on mid-range phones.

WHAT I BUILT

Shipped art, generated music, physics and UI in one HTML file with zero runtime dependencies. Fixed-timestep simulation, cached Dijkstra routing and an allocation-free hot loop.

RESULT

~80 kB total (~24 kB compressed). Headless tests drive real multi-touch.

VASATYAB

Find the fair place to meet

Enter everyone's location and get a fair midpoint.

PROBLEM

Picking a place to meet a group is a common, annoying coordination problem.

WHAT I BUILT

Built a full-stack app with account sign-up, transactional email, Mapbox maps and address search, validated forms and a Dockerised database.

RESULT

End-to-end tests with Playwright cover the main flows.

SIKTIR

Turn any link into a shareable button

Paste a URL, get a button page to share.

PROBLEM

Sharing a link with context should be one step, with a clean preview.

WHAT I BUILT

Angular Material frontend with a NestJS REST API: JWT / Passport sign-in, automatic link previews scraped from the page, and health checks.

RESULT

API tested with Jest and Supertest.

PROJECT ISLAND

A portfolio you can drive

A 3D island where every landmark is one of these projects.

PROBLEM

A list of links doesn't show how someone builds.

WHAT I BUILT

Built a drivable 3D world: each landmark opens a project dossier, with project-themed mini-games and live races between visitors.

RESULT

Multiplayer runs peer-to-peer between browsers, with no game server.

Three.js

WebGL

WebRTC

NEXT STEP

Let's build the next one together.

Looking for a founding-engineer or engineering-lead role on a product with hard problems: complex state, real-time data, graphics or performance.

- 2024 – now Senior Frontend Developer, Farineh Fanavar · industrial HMI design studio
- 2021 – 2024 Full-stack Developer, Freelance
- 2020 – 2021 DevOps Engineer, Bookbal
- 2016 – 2019 Frontend Developer, Shatel
- 2012 – 2016 IT Supervisor, Soorati · Software Engineer, Asan
